

SIMATS ENGINEERING

ASSESSMENT TOOL 2

COURSE NAME: MLA03

COURSE CODE: Reinforcement learning

NAME: E.V.Mahendra Reddy

REGISTER NUMBER:192425214

COURSE OUTCOME COVERED

***CO1:** Analyse reinforcement learning frameworks and Markov Decision Process concepts to model decision-making problems. (BL2, BL3)*

Assessment Tool Weightage: 50%

Dr G.A. SENTHIL
QUESTIONS: 10

Total Marks:50

Annexure A

Constraint - Based Problem-Solving

Duration: 2Hrs

1. Develop a Python-based Reinforcement Learning model using the OpenAI Gym environment to solve a Grid World navigation problem where the agent must reach the goal while avoiding obstacles. Explain how the state space, action space, reward function, and constraints are defined.
(10 Marks)
2. Implement an ϵ -greedy Multi-Armed Bandit algorithm in Python to maximize rewards under a limited budget of 500 trials. Compare the effect of different ϵ values (0.1, 0.3, and 0.5) on exploration, exploitation, and constraint satisfaction.
(10 Marks)
3. Design a Markov Decision Process (MDP) for an autonomous robot that must reach a destination while minimizing energy consumption. Define the states, actions, transition probabilities, rewards, and energy constraints.
(10 Marks)
4. Using Python and TensorFlow/Keras, implement a value iteration algorithm to determine the optimal policy for a constrained grid environment where certain states are restricted. Explain how Bellman equations are used to obtain the optimal policy.
(10 Marks)
5. A warehouse robot has a battery capacity of only 30 minutes. Design an RL framework that enables the robot to complete the maximum number of deliveries without exceeding the battery limit. Explain the constraints, policy, and reward design.
(10 Marks)

6. Implement a Reinforcement Learning agent that controls traffic signals at an intersection while ensuring that emergency vehicles receive immediate priority. Explain how exploration, exploitation, and policy learning are modified to satisfy the safety constraint.

(10 Marks)

7. Develop a Python program using Keras/TensorFlow to simulate a reinforcement learning agent for packet routing in a wireless network with limited bandwidth. Explain how bandwidth constraints influence the reward function and policy optimization.

(10 Marks)

8. Analyse an experimental comparison between random action selection and ϵ -greedy action selection in a Multi-Armed Bandit problem under a fixed time constraint. Record cumulative rewards and explain which strategy provides better performance.

(10 Marks)

9. Design a Reinforcement Learning framework for a delivery drone that must maximize successful deliveries while avoiding no-fly zones and maintaining battery limits. Explain the MDP formulation, Bellman equation, and policy learning process.

(10 Marks)

10. Implement a Reinforcement Learning solution using Python for a smart energy management system where electricity consumption must remain below a specified threshold. Explain how reward shaping, policy learning, and feasibility constraints improve decision-making.

(10 Marks)

EXPERIMENT - 1

Aim- To develop a Python-based Reinforcement Learning model using the OpenAI Gym environment that enables an agent to navigate a Grid World, reach the goal efficiently, and avoid obstacles by learning an optimal policy.

```

EXPERIMENT - 8

Aim-To analyse and compare the performance of random action selection and ϵ -greedy action selection in a Multi-Armed Bandit problem by evaluating cumulative rewards under a fixed time constraint.

The screenshot shows a Python script named 'QUESTION-8.py' and its execution output in an IDLE Shell. The script defines a Multi-Armed Bandit problem with 10 actions and rewards [4, 7, 2, 10]. It compares two strategies: Random Action Selection and Epsilon-Greedy Strategy. The Epsilon-Greedy strategy performs better, achieving a higher total reward (94) compared to the Random strategy (85).

```
import random
rewards = [4, 7, 2, 10]
epsilon = 0.2
steps = 10
print("==== Random Action Selection =====")
random_total = 0
for i in range(1, steps + 1):
    action = random.randint(0, len(rewards) - 1)
    reward = rewards[action]
    random_total += reward
    print(f"Step {i}: Action = {action}, Reward = {reward}")
print(f"\nTotal Reward (Random):", random_total)
print("==== Epsilon-Greedy Strategy =====")
greedy_total = 0
for i in range(1, steps + 1):
    if random.random() < epsilon:
        action = random.randint(0, len(rewards) - 1)
        strategy = "Exploration"
    else:
        action = rewards.index(max(rewards))
        strategy = "Exploitation"
    reward = rewards[action]
    greedy_total += reward
    print(f"Step {i}: (strategy) -> Action = {action}, Reward = {reward}")
print(f"\nTotal Reward (Epsilon-Greedy):", greedy_total)
print("==== Comparison =====")
if greedy_total > random_total:
    print("Epsilon-Greedy performed better.")
elif greedy_total < random_total:
    print("Random Strategy performed better.")
else:
    print("Both strategies performed equally.")
```

```

RUBRICS FOR CALCULATION

Criteria	Weightage	Level 4 (Exemplary)	Level 3 (Proficient)	Level 2 (Developing)	Level 1 (Beginning)
Problem Understanding	25%	Clearly defines the problem and identifies all relevant constraints accurately	Identifies most constraints with minor gaps	Partial understanding; misses key constraints	Fails to identify constraints correctly
Constraint Analysis	25%	Analyzes constraints effectively and prioritizes them logically	Provides reasonable analysis with some prioritization	Limited analysis; weak prioritization	No meaningful analysis or prioritization
Solution Development	25%	Develops optimal and feasible solutions satisfying all constraints	Develops workable solutions with minor limitations	Solutions partially satisfy constraints	Solutions do not meet constraints
Application of Concepts	15%	Effectively applies appropriate concepts, methods, or tools	Applies concepts with minor errors	Limited application; requires guidance	Unable to apply relevant concepts
Justification	10%	Provides strong justification for decisions with logical reasoning	Provides justification with some clarity	Weak or unclear justification	No justification provided
